

SUBSTITUTE ABSTRACTA²

In order to produce mechanical connections without additional measures being required, the base part, side walls and rear wall of the sheet-metal casing comprise a single sheet-metal part. The side walls have a cutout in the region of the top rear corner, and the rear wall has an angled section which, on its sides, has hook-like extensions which snap into the cutouts of the side walls when the actual rear wall is swung into position.

1. A sheet-metal casing for a device, comprising a base part, side walls and a rear wall, wherein the base part, side walls and rear wall are formed from a single sheet-metal part, the side walls having a cutout in the region of the top rear corner, and the rear wall having an angled section which, on its sides, has hook-like extensions which snap into the cutouts of the side walls when the actual rear wall is swung into position.
